

SLIGHTLY IMPROVING ECONOMIC EXPECTATIONS

GKI-Erste economic confidence index adjusted for seasonal effects has been slightly improving since September. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, in December expectations have improved in the business sector for three consecutive months, whereas they have increased among consumers for two months. The year-end expectations are slightly more favourable than they were at the beginning of 2012, when a money market crisis was looming. However, they did not reach their level of April, which was very low anyway.

As far as the **business sector** was concerned, in December industrial expectations remained unchanged, expectations in construction and trade deteriorated, whereas those of service companies improved significantly. In **industry** the assessment of the stock of orders deteriorated, whereas that of the actual and future level of production, as well as supplies, improved. Following its significant increase in November, the **construction** confidence index decreased significantly in December. Compared with the previous month, the assessment of the production level and the stock of orders of the previous three months became more unfavourable as well. The increasing pessimism in **trade** can be explained by the deterioration of the stock of orders. However, sales positions were assessed better by respondents. In December the **services** confidence index continued to improve, which started in November, and the assessment of the turnover and the number of employed in the last period also got better.

Intentions to employ improved in industry, in services and slightly in trade, whereas they weakened in construction significantly. The fear from unemployment of households eased. **Intentions to raise prices** remained unchanged in industry and services. Companies in the construction industry were again forced to reduce their prices, whereas companies in trade expected a price increase. The inflationary expectations of consumers eased. The **assessment of the perspectives of the Hungarian economy** was less pessimistic in industrial and service companies, as well as among consumers, whereas it deteriorated in construction and trade. Although nobody expects improvement, only slightly less than half of the respondents in industry predict further deterioration.

Following its increase in November, **GKI's consumer confidence index** continued to rise, though at a somewhat lower rate, reaching its level of September. Consumers assessed their savings capacity and their financial situation for the following year similarly as in November. However, they considered the possibility of purchasing high-value durables somewhat better.

Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new ‘TEAOR o8’ codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.

A GKI-ERSTE ECONOMIC SENTIMENT INDEX AND ITS ELEMENTS, 2008-2012

Year	Month	Business confidence index	Consumer confidence index	GKI-Erste economic sentiment index
2008.	I.	-9.6	-47.8	-19.5
	II.	-7.6	-47.6	-18
	III.	-8.1	-52.4	-19.7
	IV.	-11.8	-55.4	-23.2
