BUSINESS EXPECTATIONS IMPROVED IN AUGUST

The GKI-*Erste* economic sentiment index adjusted for seasonal effects moved upwards slightly in August. This is the result of an improvement in business expectations as the consumer confidence index declined. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, following their improvement in the spring, economic expectations remained unchanged during the summer.

In August, in the **business sphere** service companies became more optimistic, whereas the expectations of industrial and construction companies changed barely, and that of trading firms remained unchanged. Despite the improvement in August, the **industrial** confidence index remained below its level of June. The assessment of the production of the preceding period, as well as that of the stock of export orders improved significantly, whereas the evaluation of the production of the next three months, the total stock of orders and inventories improved only slightly. The almost unbroken rise of the **construction** confidence index in 2013 continued in August; however, the assessment of the production level and the stock of orders of the previous three months deteriorated slightly. The **trade** confidence index stagnated after its slight increase in July. The assessment of sales positions and expected orders picked up slightly; whereas the stock of orders was considered increasing by respondents. The **service** confidence index rose significantly in August, primarily due to the favourable assessment of the general business climate and sales in the subsequent period.

The **intentions of employment** in industry and construction improved, whereas they did not change in services and they deteriorated slightly in trade. The fear from unemployment of households strengthened significantly. Domestic producer **prices** can be expected to be stagnant in the next few months. However, in trade the share of firms planning price rises and the size of price rises, too, increased. The inflationary expectations of consumers rose as well. The assessment of the **Hungarian economy's prospects** in industry and construction remained unchanged, whereas it improved in trade and services after a big decline in July. However, households became more pessimistic.

The GKI **consumer confidence index** dropped in August, though to a lesser extent than its increase in July. Households assessed their financial situation for the following year slightly better and their saving capacity somewhat worse. People considered the current conditions of purchasing high-value durables somewhat better than before, whereas their expectations for the next 12 months turned worse slightly in this respect.

EXPLANATION TO THE METHODOLOGY:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction, services and households in the calculation of its business confidence index. GKI-Erste economic sentiment index is the weighted average of the consumer confidence index and the business confidence index.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations of turnover and employment. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g., differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

The consumer confidence index is calculated from responses given to questions concerning the expected financial position of households, the expected economic and unemployment situation of the country, and the prospects for saving.

GKI-ERSTE ECONOMIC SENTIMENT INDEX AND ITS ELEMENTS, 2008-2013

Year	Month	Business confidence index	Consumer confidence index	GKI-Erste economic sentiment index
2008.	I.	-9.6	-47.8	-19.5
	II.	-7.6	-47.6	-18
