

GKI-ERSTE ECONOMIC SENTIMENT INDEX GAINED MOMENTUM AGAIN IN SEPTEMBER

In September, according to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, business and especially consumer expectations improved noticeably reaching their peaks this year after a stagnation in summer. The trend of the GKI-Erste economic sentiment index adjusted for seasonal effects has been rising since the end of 2012, and the same value was reached last time in the spring of 2011.

Expectations improved in all sectors of the **business sphere** except for services. The **industrial** confidence index was close to its 2012 spring level. The assessment of past production, production prospects and the stock of orders, except for exports, improved compared with August. Respondents qualified the stocks of own production smaller than before. Although the almost uninterrupted and significant improvement of expectations that has been characteristic of **construction** this year continued in September, it is still the most pessimistic industry. The evaluation of the production level of the past three months deteriorated slightly but that of orders improved. In **trade** the assessment of sales positions and the level of stocks improved slightly, whereas that of expected orders picked up considerably. The drop of the **services** confidence index was a correction of its spectacular rise in September. The assessment of the state of business and the sales outlook also contributed to the decline of the index. Respondents assessed the sales of the previous three months decreasing, too.

Intentions of raising employment deteriorated slightly in industry and trade, remained unchanged in services and improved in construction. Fear of unemployment eased significantly among households. The extent of **efforts to raise prices** remained more or less unchanged in all sectors, whereas the inflationary expectations of consumers decreased markedly. The assessment of the perspectives of the **Hungarian economy** improved in every industry, especially in trade, and it improved spectacularly among consumers.

Following a decrease in August, **GKI consumer confidence index** increased considerably in September. Households assessed their financial situation for the following year somewhat better and their saving capacity much better than in the previous month. Households considered the possibility of purchasing high-value durables better as well.

EXPLANATION TO THE METHODOLOGY:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction, services and households in the calculation of its business confidence index. GKI-Erste economic sentiment index is the weighted average of the consumer confidence index and the business confidence index.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations of turnover and employment. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g., differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

The consumer confidence index is calculated from responses given to questions concerning the expected financial position of households, the expected economic and unemployment situation of the country, and the prospects for saving.

GKI-ERSTE ECONOMIC SENTIMENT INDEX AND ITS ELEMENTS, 2008-2013

Year	Month	Business confidence index	Consumer confidence index	GKI-Erste economic sentiment index
2008.	I.	-9.6	-47.8	-19.5
	II.	-7.6	-47.6	-18
	III.	-8.1	-52.4	-19.7
	IV.	-11.8	-55.4	-23.2
