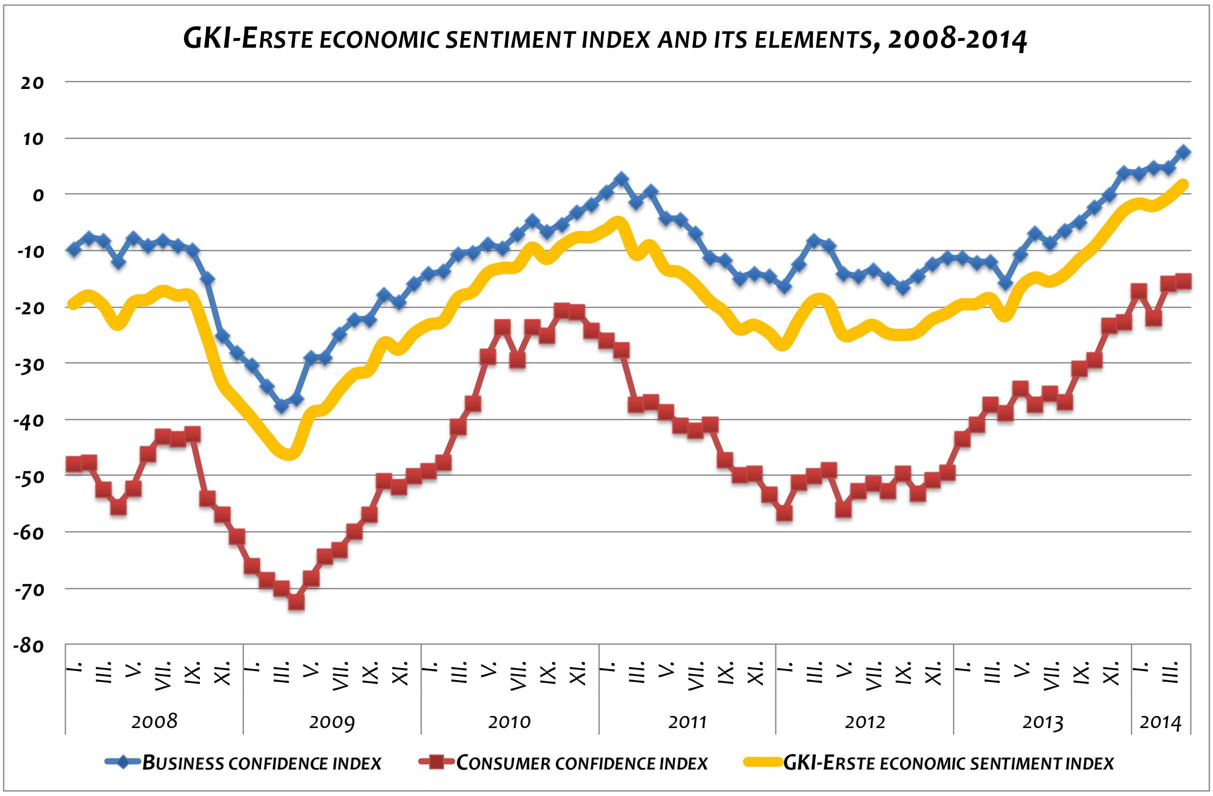
GKI-ERSTE ECONOMIC SENTIMENT INDEX CONTINUED TO RISE IN APRIL

In April the GKI-Erste economic sentiment index adjusted for seasonal effects continued its spectacular rise started one and a half years ago. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, the last time when expectations were as favourable as now had been more than one and a half decades ago. Companies were such optimistic last time in the summer of 1998, whereas consumers in the spring of 2006.

In April in the **business sphere** expectations became more upbeat in all sectors except trade, particularly in construction. The proportion of optimistic companies has exceeded that of pessimists in all sectors except construction; however, the lag is not significant. The **industrial** confidence index rose markedly in April, though its level is "only" a four-year record. The assessment of past production worsened, whereas that of prospects, stocks and incoming orders improved (though the evaluation of export orders worsened). The **construction** confidence index rose very strongly in April, such a change was experienced last time in February 2013. The assessment of the production level and the stock of orders of the previous three months improved as well. The average length of the production period filled with valid orders (4.2 months) reached a six-year peak. In April the **trade** confidence index fell to its February level. The assessment of sales positions and expected orders picked up slightly; whereas the level of stocks was considered much higher than in March by respondents. The rise of the **services** confidence index was caused by the optimistic assessment in expected turnover.

The **intentions of employment** improved in industry and especially in construction, whereas it deteriorated in trade and services. The fear of unemployment of households eased. **Intentions to raise prices** increased slightly in all sectors with the exception of trade. It has happened first for a long time in construction that the share of companies planning to lift prices exceeded slightly those planning to decrease prices. However, the inflationary expectations of consumers continued to drop a bit. The assessment of the **perspectives of the Hungarian economy** improved in every industry and among consumers as well.

The **consumer confidence index of GKI** grew slightly in April, reaching its eight-year peak. Households assessed their financial situation for the following year better and their saving capacity worse than in March.



Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction, services and households in the calculation of its business confidence index. GKI-Erste economic sentiment index is the weighted average of the consumer confidence index and the business confidence index.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations of turnover and employment. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g., differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

The consumer confidence index is calculated from responses given to questions concerning the expected financial position of households, the expected economic and unemployment situation of the country, and the prospects for saving.

GKI-Erste economic sentiment index and its elements, 2008-2014

Year	Month	Business confidence index	Consumer confidence index	GKI-Erste economic sentiment index
2008.	I.	-9.6	-47.8	-19.5
	II.	-7.6	-47.6	-18
	III.	-8.1	-52.4	-19.7
