

AFTER TWO MONTHS OF DETERIORATION, EXPECTATIONS IMPROVED IN SEPTEMBER

The GKI-Erste economic sentiment index adjusted for seasonal effects moved upwards slightly in September, continuing the stagnation with minor fluctuations observed in recent months. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, expectations improved somewhat both in the business sector and among consumers, thus reflecting overall confidence.

Business expectations improved in all sectors except construction in September. After a three-month decline, the **industrial** confidence index has been increasing slightly, and in September it again reached its level at the beginning of the summer. The improvement is the result of more favourable expectations concerning production prospects and the total stock of orders. The assessment of the production of the preceding period and that of export orders deteriorated, whereas that of stocks remained unchanged. The **construction** confidence index fell within the statistical margin of error in September. The assessment of production in the preceding three-month improved significantly; that of orders remained unchanged. After August, the **trade** confidence index rose again, approaching its record value in January. The assessment of sales positions deteriorated, whereas that of expected orders and the level of stocks were more favourable. The increase in **services** confidence index in September was mainly due to a significant improvement in the overall business climate. Turnover expectations were also better than in August.

The intentions of **employment** in trade have been improving for months, whereas in September they weakened slightly in industry and remained unchanged in construction and services. The fear of unemployment of households eased. Intentions to **raise prices** are very modest in all sectors. However, inflationary expectations in trade and among consumers increased. The evaluation of the prospects of the **Hungarian economy** improved significantly in all sectors as well except for industry and among consumers.

Following a decrease in August, **GKI consumer confidence index** increased by the same extent in September. Households assessed their financial situation, the possibility of purchasing high-value durables, and their savings capacity for the following year slightly more favourable than in August.

EXPLANATION TO THE METHODOLOGY:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction, services and households in the calculation of its business confidence index. GKI-Erste economic sentiment index is the weighted average of the consumer confidence index and the business confidence index.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations of turnover and employment. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g., differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

The consumer confidence index is calculated from responses given to questions concerning the expected financial position of households, the expected economic and unemployment situation of the country, and the prospects for saving.

GKI-ERSTE ECONOMIC SENTIMENT INDEX AND ITS ELEMENTS, 2008-2014

Year	Month	Business confidence index	Consumer confidence index	GKI-Erste economic sentiment index
2008.	I.	-9.6	-47.8	-19.5
	II.	-7.6	-47.6	-18
