

GKI-Erste economic confidence index recovered in April after its fall in March

GKI-Erste economic confidence index adjusted for seasonal effects improved slightly after its sharp fall in March. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU **business expectations improved notably, whereas consumer expectations** turned better only minimally, but they were less optimistic than in February.

The only exception was the **industrial** confidence index that has continued its increasing trend that had started two years ago and reached its year-high value. The assessment of the actual and the future production level and the evaluation of the stock of orders-among this that of exports-improved and stocks were considered less by the respondents. Capacity utilisation moved above 80 per cent.

The confidence index in **construction** stagnated basically in April compared to March. Opinions over the level of production and the stock of orders in the preceding three months deteriorated but employment improved. Following a two-month drop, expectations in **trade** improved slightly in April. Although expectations on orders deteriorated slightly further, the assessment of the stock of orders and sales positions improved somewhat. Expectations in **services** fell slightly. The deterioration of the assessment of the state of the business played the most important part in it, whereas the evaluation of expected sales revenues improved slightly among the respondents.

Intentions to employ were quite different in the individual sectors: they stagnated in industry, improved in construction, deteriorated in trade and services. In households fear from unemployment was on the rise. **Intentions to raise prices** dropped notably, but inflationary expectations of consumers got stronger. In industry the size of the price rise was smaller, but the scope of the price increase was broader. In construction the share of those reckoning with decreasing prices exceeded that of those anticipating rising prices in April more than in the previous month. In trade the share of firms planning price rises and the size of price rises, too, decreased. In services intentions to increase prices dropped, too. The **assessment of the perspectives of the Hungarian economy** improved slightly in most of the industries and among consumers as well after its sharp fall in March, but in construction it continued to deteriorate significantly.

The **consumer confidence index** of GKI increased-within the statistical margin of error-after a five-month drop that also included a sharp decline in March. Households assessed their financial situation worse for the next 12 months but they turned more upbeat concerning their expected savings capacity compared to the previous month. Respondents considered the current conditions of purchasing high-value durables better but their expectations for the next 12 months turned worse in this respect.

Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-First economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
