

Industrial expectations deteriorated in a surprising extent

In May **GKI-*Erste economic confidence index*** adjusted for seasonal effects fell to its annual low. According to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU the decrease recorded in March and the correction of April was followed by deterioration in May that was more pronounced in business expectations and somewhat slighter in consumer sentiment.

In the business sector the value of **industrial** confidence index plummeted spectacularly, by nine points in one month compared with the previous one. This was without precedent in the history of the index. Following a continuous improvement of nearly two years, the deterioration of industrial expectations was an unexpected development. The negative change characterised all company groups and fields of activity. Industrial companies perceived the production of both the preceding and the next period more pessimistically than one month ago. The evaluation of the stock of orders including that of exports, too, became more downbeat. Nevertheless, respondents qualified the stocks of own production larger than earlier.

Construction is still the most pessimistic industry. The deterioration of expectations continued in May. The evaluation of the production level and the stock of orders improved somewhat, but the intentions of employment deteriorated markedly.

The confidence index of trade increased slightly, within this that relating to orders was up significantly. Respondents recorded increasing stock levels and modestly improving sales positions. The confidence index of **service companies** grew slightly, the evaluation of the general business climate and sales of the preceding and the subsequent period improved.

The **intentions of employment** weakened in industry and construction, they improved in trade and remained unchanged in services. The fear from unemployment of households strengthened. **Intentions of price increases** weakened in all industries. In industry the share of those planning price rises decreased from 21 per cent in April to 11 per cent in May and the share of those reckoning with price reductions, too, dropped. In construction those anticipating price decreases are in majority against those projecting price rises. The situation was similar in services in May. In trade the share of those planning price rises decreased in one month. The average size of price increases, too, diminished. The inflationary expectations of consumers eased as well. **The evaluation of the prospects of the Hungarian economy** has been deteriorating significantly in almost every industry and among consumers for the third month.

The **consumer confidence index** of GKI has been decreasing continuously and significantly in 2011. In May households assessed their financial situation worse for the next 12 months than in April, and they considered the current conditions of purchasing high-value durables substantially worse. Their expectations for the next 12 months turned slightly better concerning savings.

Explanation to the methodology:

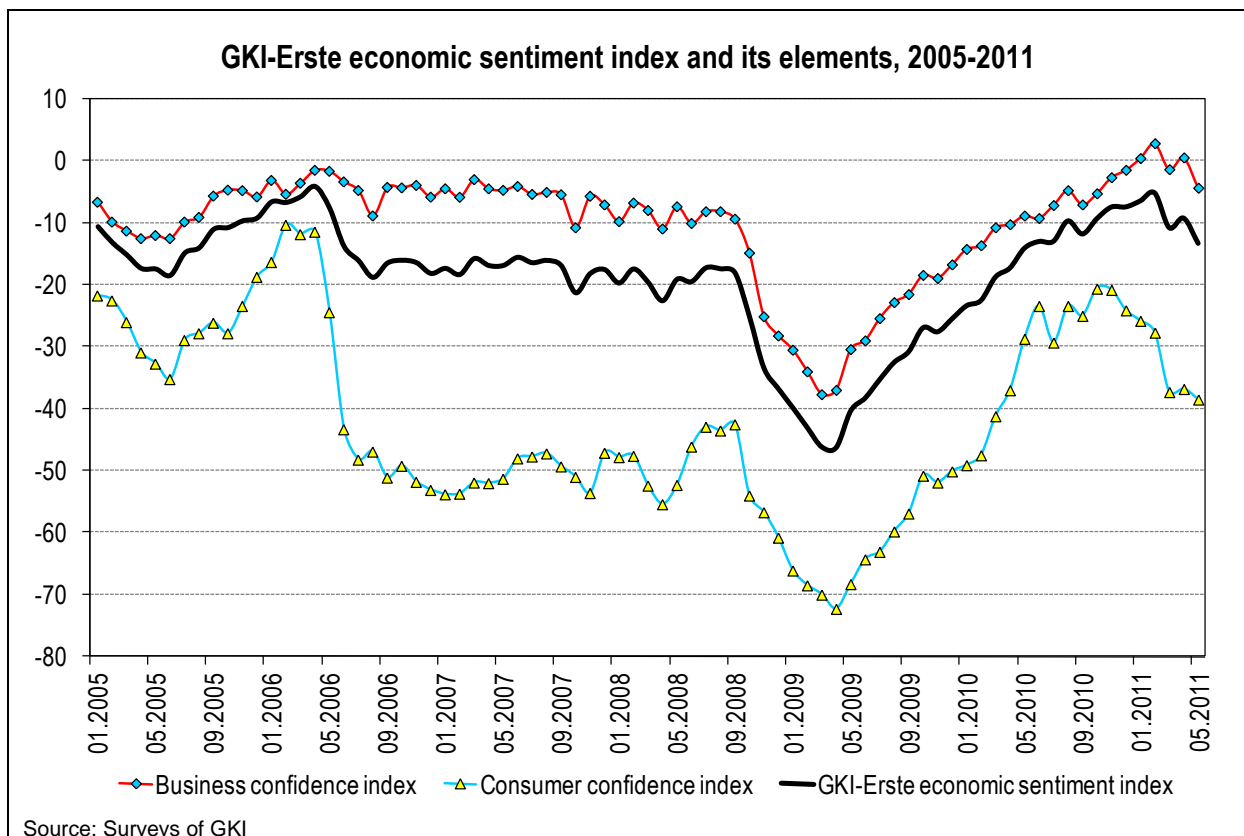

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
