

Further decline in business and consumer expectations

In October the GKI-Erste economic sentiment index adjusted for seasonal effects continued to deteriorate. According to the empirical survey conducted by GKI with the support of the EU the declining trend has been going on for eight months. Business and consumer expectations also deteriorated in October, reaching their fairly low levels of late 2009 and early 2010.

In October except the confidence indices dropped in all sectors in the **business sphere**; in construction, which was by far the lowest one and it declined significantly in September, too. In accordance with European trends **industrial** expectations have declined for half a year. Only the assessment of self-produced inventories improved over the previous month; the assessment of production and orders (including export orders) of the last period and the following quarter deteriorated significantly. Following a significant decline in September, the **construction** confidence index adjusted upwards in October. The evaluation of the production level of the past three months deteriorated slightly but that of orders improved. Following a modest positive correction in September, the **trade** confidence index declined significantly in October. While sales positions deteriorated and inventory levels slightly increased, expectations on orders plummeted. The **service** confidence index deteriorated in October but to a lesser extent than the trade one. The assessment of turnover for the past period and for the next one became more unfavourable.

The **intentions of employment** in industry became much worse: the ratio of those planning reduction in employment significantly exceeded the ratio of those planning expansion. The trade and service sector slightly weakened, construction gained strength, and the fear from unemployment of households intensified. **Intention to raise prices** increased in all sectors except construction, where those predicting a significant fall in prices represent a growing majority over those considering price increases. Inflationary expectations of households continued to intensify. The **assessment of the Hungarian economy** plummeted in industry, whereas it declined in commerce, services and among households, and it stagnated in construction.

The **GKI consumer confidence index** has been declining steadily for almost a year. Households assessed their financial situation worse for the next 12 months compared with the previous month. The assessment of savings capacity and purchasing high-value consumer durables for the following year was also worse than in the previous month.

Explanation to the methodology:

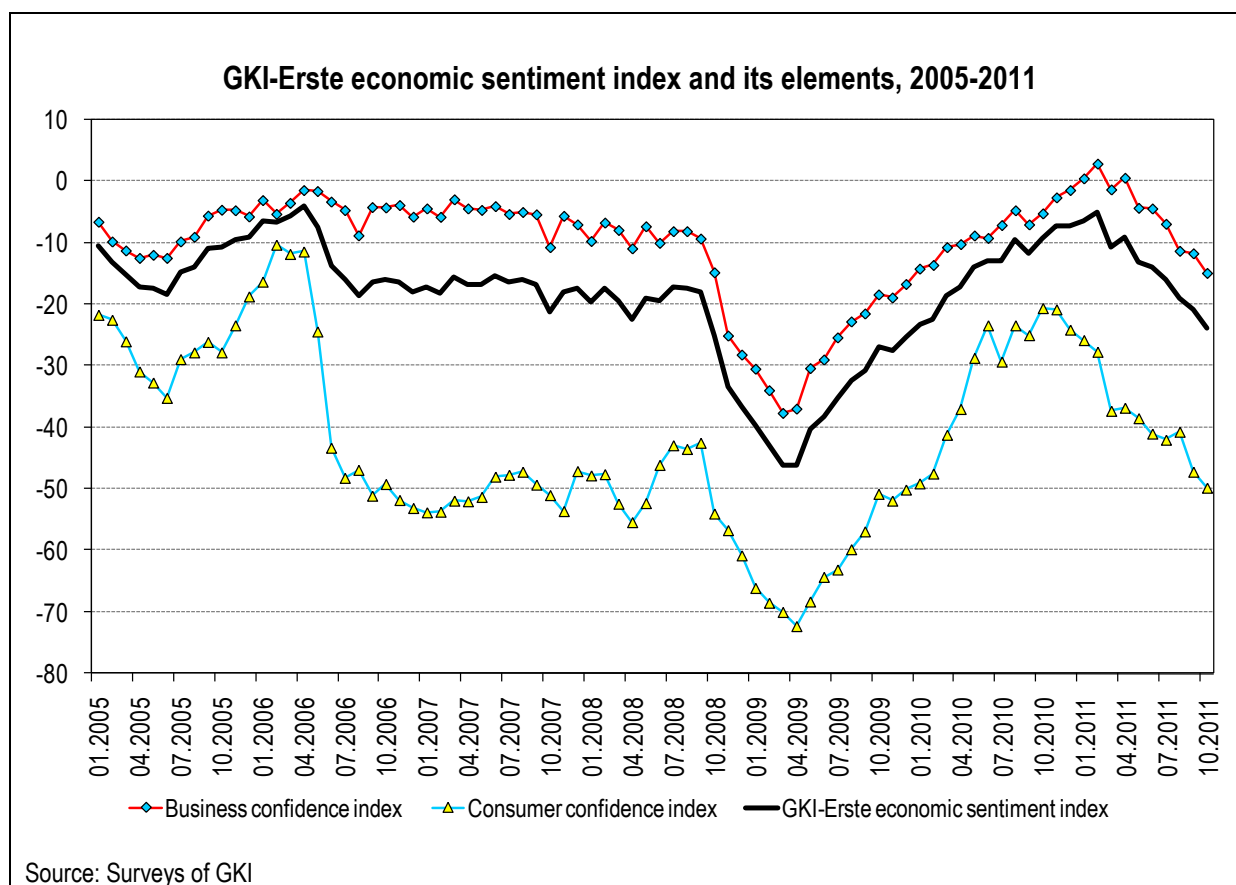

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
