

GKI-Erste economic sentiment index rose to its last autumn level

In February, the GKI-Erste economic sentiment index adjusted for seasonal effects rose to its last autumn level following a continuous decline of almost one year. According to the empirical survey conducted by GKI with the support of the EU, pessimism deteriorated to a greater or lesser extent in all sectors (except construction) and among consumers as well compared with January.

In the **business sector** expectations of industrial and service companies improved significantly, whereas those of trading enterprises only slightly. The expectations of construction companies worsened noticeably. Following a decline of four months the **industrial** confidence index increased substantially, and it returned to its 2011 autumn level. The assessment of past production and the stock of orders (including exports) improved, whereas that of stocks of own production turned downbeat slightly. After stagnation in January the **construction** confidence index fell sharply in February. Although the assessment of the level of production of the previous three months improved significantly, that of the stock of orders and employment opportunities was less favourable. The **trade** confidence index only slightly improved in February, by an extent much less than its decrease in January. The assessment of orders became more positive, whereas that of sales positions deteriorated and that of the level of stocks stagnated. The present increase in the **services** confidence index eliminated a significant part of its decline during the previous two months. The assessment of the state of business became a bit worse; however, that of the sales outlook was much better.

Intentions to employ picked up in all sectors except construction; however, the number of companies planning a reduction of their workforce was greater than the number of those planning an increase. The fear from unemployment of households eased. **Intentions to raise prices** weakened in all sectors except construction. Although the deflationary pressure eased in construction, those predicting lower prices continued to be the majority. The inflationary expectations of consumers strengthened again, in line with its half-year trend, following a temporary fall in January. In February, the **assessment of the perspectives of the Hungarian economy** improved much in all sectors and among consumers as well; however, those anticipating deterioration were still in majority.

In February, the **GKI consumer confidence index** rose, interrupting a trend of almost continuous decline of one and a half years, and reaching a value slightly above its level in December 2011. In February, the pessimism of households abated in almost every respect, including their expected financial positions and savings capability, as well as the possibility of purchasing high-value durables. Although the assessment of the present situation hardly improved, that of the future was noticeably better.

Explanation to the methodology:

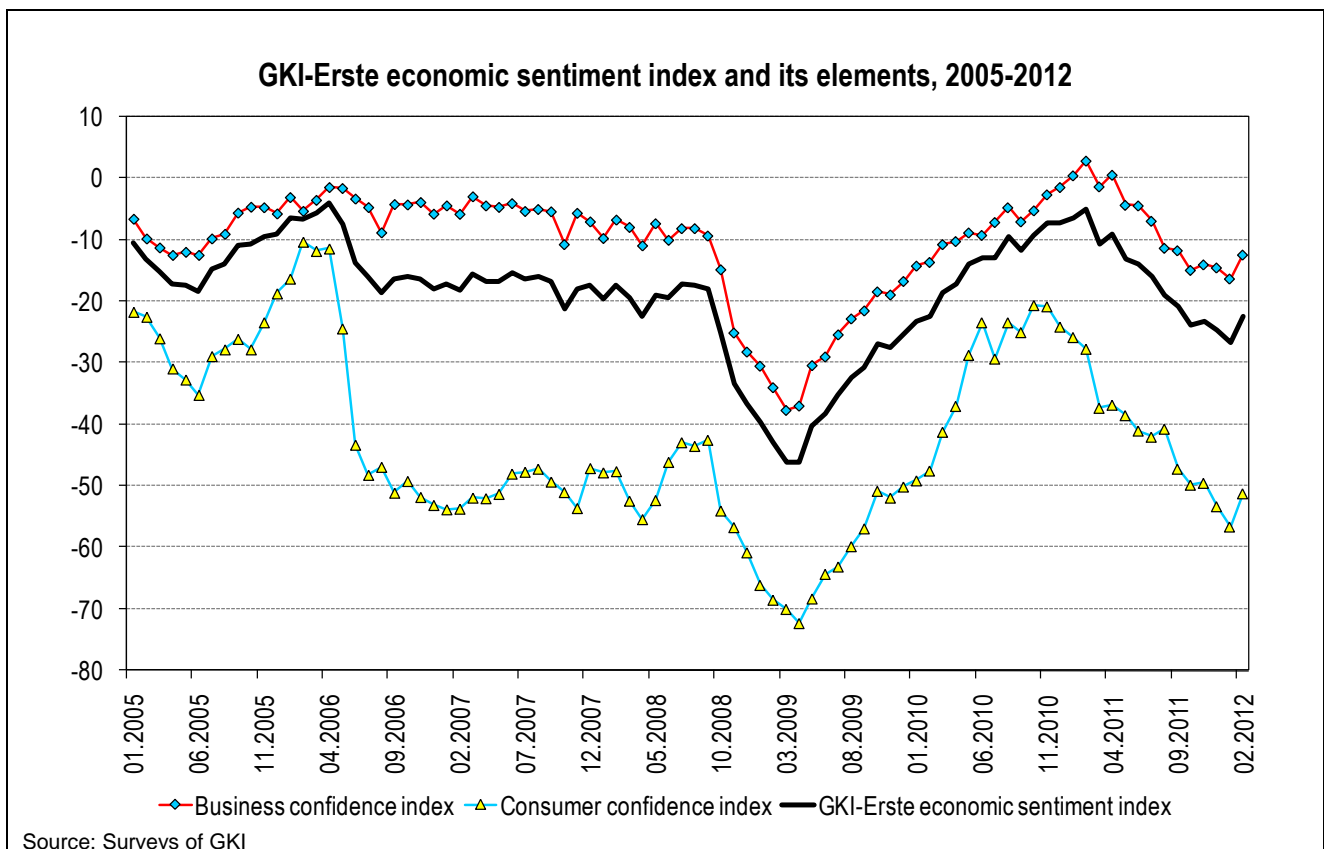

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
