GKI-Erste economic sentiment index stagnated in June

Following the plunge in May **GKI-Erste economic sentiment index** (adjusted for seasonal factors) was close to stagnation in June. According to the survey prepared by GKI (www.gki.hu) with the sponsorship of the EU, business expectations deteriorated further slightly. On the other hand, consumer expectations improved conceivably, however, they did not make up for the fall of the previous month.

In June changes in the **business sector** were within the margin of error. The **industrial** confidence index declined somewhat further. The evaluation of the state of production and the stock of orders did not change; that of export orders improved slightly but prospects became more downbeat. The confidence index of **construction** went up somewhat. The evaluation of the production level in the preceding three months worsened further, that of the stock of orders improved somewhat. The confidence index of **trade** went up a little. The assessment of sales positions deteriorated amid decreasing inventory stocks, whereas expectations of orders were perceived as increasing by the respondents. Expectations in **services** deteriorated slightly; those of sales were down much more.

Intentions of raising employment weakened in industry and trade and slightly in construction as well. They did not change among service providers. Fear for unemployment did not intensify among consumers. Following construction, in industry, too, those expecting **price decreases** were in majority, but only slightly. The share of those planning price increases decreased further among companies in trade and the average rate of price increases went back, too. Nevertheless, inflationary expectations among consumers intensified a bit. **The assessment of the perspectives of the Hungarian economy** deteriorated sharply in every industry. It improved among consumers slightly, but at a slower rate than the deterioration was in May.

In June **GKI's consumer confidence index** increased in June, the rate of the rise was half of the great plunge of May. The level of the index is still at the value recorded in October 2009. Households evaluated their financial situation and their savings capacity for the next year somewhat more favourable than one month ago. Nevertheless, the assessment of the financial situation of households was at an unprecedented low level not having recorded since the launch of the confidence index.

Explanation to the methodology:

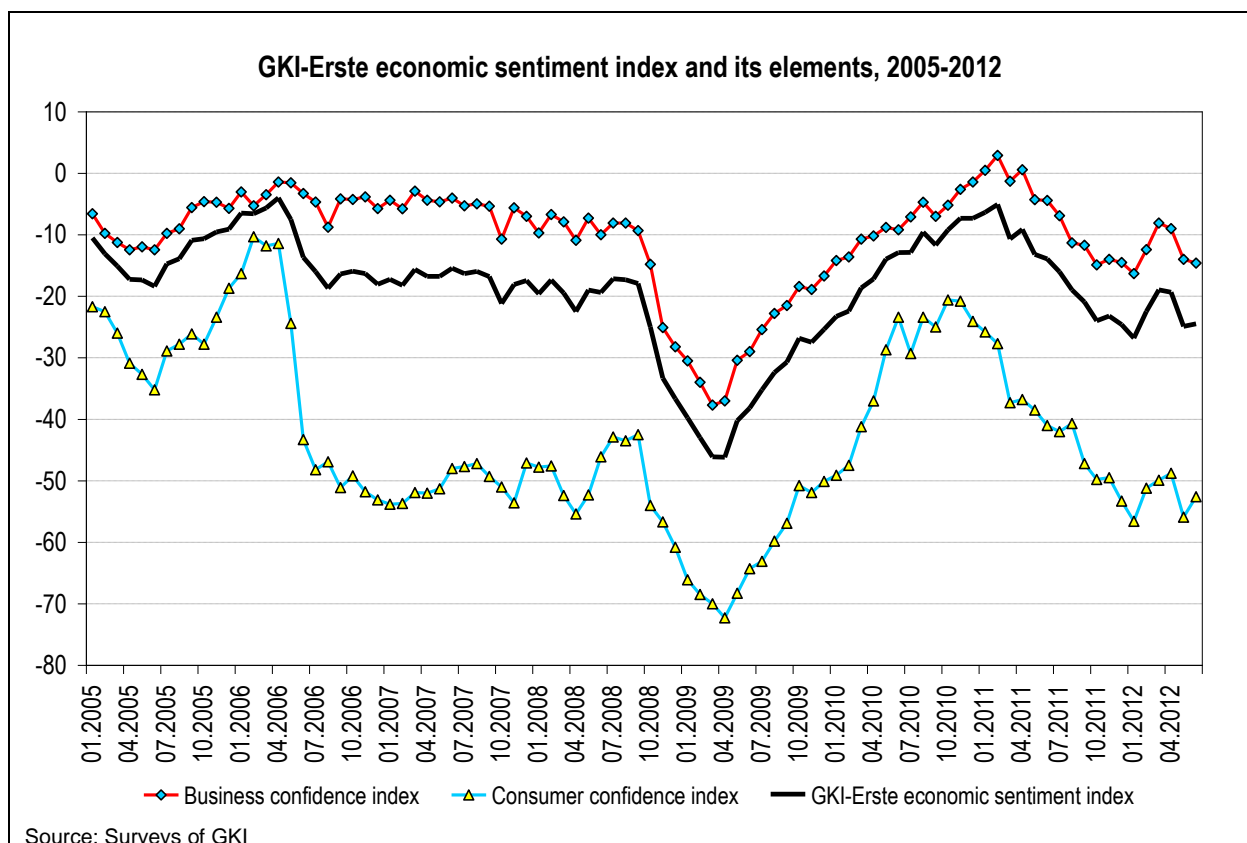

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
