

GKI-Erste economic sentiment index hardly increased in July compared to this year's low point

Following its fall in May, **GKI-Erste economic sentiment index** adjusted for seasonal effects slightly increased in June and July; however, it regained only less than half of its previous fall. Though according to the empirical survey conducted by GKI (www.gki.hu) with the support of the EU, business and consumer expectations slightly improved in July, they continues to be characterized by deep pessimism.

In July, in the **business sphere** changes were within the margin of error in all sectors. The modest increase was experienced after a continuous decrease of three months. The industrial confidence index increased slightly, due to primarily a more favourable production outlook and the fact that respondents assessed the production and the stock portfolio of the last period somewhat better. However, the assessment of the stock of orders remained unchanged and that of exports declined. Capacity utilization is lower than a quarter of a year earlier, and the assessment of the relationship between capacity and expected demand, as well as the evaluation of competitiveness became less favourable. In **construction**, the slight improvement of the confidence index in July was due to the more favourable assessment of the production level and the stock of orders of the previous three months. However, in **trade** the confidence index declined somewhat. The assessment of sales positions, with rising inventory levels, declined significantly, whereas orders are expected to improve. The **services** confidence index was unchanged in July. Global assessment of the business deteriorated, whereas the turnover is expected to improve. However, many companies reported unused capacity.

The **intentions of employment** in industry and trade improved slightly, and it deteriorated in construction and services. The fear from unemployment of households eased. Though the share of firms **planning price rises** increased in industry, the proposed level of price changes did not change. No factors have changed in construction and those predicting lower prices continue to be the majority. Service companies also expected lower prices. In trade the share of those planning price rises decreased considerably. The average size of price increases, too, diminished. In July, the outlook for the **Hungarian economy as a whole** was somewhat less negative in all sectors and among consumers than in the previous month.

GKI consumer confidence index also increased slightly in June and July; however, it is still lower than it was in April, reaching only its 2009 autumn level. Households assessed their financial situation better for the next 12 months but they turned more downbeat concerning their expected savings capacity compared to June. Consumers assessed their own financial situation somewhat less pessimistic compared with the preceding months' low level not having recorded since the launch of the confidence index.

Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
