

Domestic expectations are permanently very pessimistic

Following the almost permanent and pronounced fall in 2011, **GKI-Erste confidence index** (adjusted for seasonal factors) was close to stagnation in the first eight months of 2012. The modest increase at the end of 2011 was followed by a plunge in May and modest sideway movements since then. According to the survey prepared by GKI (www.gki.hu) with the sponsorship of the EU, **business and consumer expectations deteriorated further slightly in August** reflecting a very downbeat mood.

In the **business sector** expectations in industry deteriorated palpably, those in construction and trade less significantly and pessimism in services eased somewhat. Following the slight increase in June and July, the industrial confidence index decreased again in August to the level of two and a half years ago. Compared to June the evaluation of production, total stock of orders and production perspectives for the subsequent period deteriorated. Opinions on export orders did not change. The **construction confidence index** has not changed much since this May, it dropped somewhat in August. After a slight improvement in July the evaluation of the production level and the stock of orders concerning the preceding three months deteriorated somewhat again in August. In **trade** the assessment of sales positions became more downbeat amid slightly decreasing inventory levels, whereas expectations on orders contracted in an unprecedented rate. In **services** particularly the assessment of businesses in the preceding period improved but expectations on sales, too, turned more optimistic.

Intentions of raising employment weakened in industry and trade, they did not change in construction whereas they improved among service providers. Fear of unemployment intensified among consumers. According to the responses on GKI's survey questions received, no significant changes of **sales prices** are expected in industry and services in the near future. Nevertheless, in trade the share of those planning price increases picked up significantly in the past month and the average rate of price increases went up, too. Inflationary expectations among consumers intensified very substantially. In construction the pressure on producers to depress prices eased slightly. **The assessment of the perspectives of the Hungarian economy** deteriorated in industry. It improved more or less in the other sectors and among consumers. The share of those expecting deterioration exceeds that of those reckoning with improvement.

In August **GKI's consumer confidence index** decreased, its rate was more or less the same as that of the increase in July. Since almost a year it has been moving in a rather narrow range reflecting strong pessimism. In August households evaluated their financial situation and their possibilities of buying durables for the subsequent year somewhat worse whereas their savings capacity somewhat better than in July.

Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
