## Domestic economic expectations remained pessimistic in September

**GKI-Erste economic confidence index** adjusted for seasonal effects has been essentially unchanged since May. A modest increase at the beginning of the year was followed by a fall in May, and it has been fluctuating slightly since then. According to the empirical survey conducted by GKI ([www.gki.hu](http://www.gki.hu)) with the support of the EU, **business expectations deteriorated somewhat in September, whereas consumer expectations improved**, approaching their maximum this year reached in April.

Expectations deteriorated more or less in all sectors of the **business sphere** except for trade. Following its fall in August, the **industrial** confidence index decreased further only slightly. The assessment of the production and the stock of orders (including exports) of the last period improved, whereas that of production prospects and stocks declined. The **construction** confidence index hardly changed between May and August, but it fell sharply in September. In construction the evaluation of the production level of the past three months remained more or less unchanged, whereas that of orders deteriorated significantly. The **services** confidence index fell the most in September, and the evaluation of the general business climate and sales of the preceding and the subsequent period worsened. In contrast, the **trade** confidence index rose slightly after two months of slight decline. The assessment of sales positions improved somewhat, though respondents considered the level of stocks declining. Pessimism concerning new orders continued to increase.

**Intentions to employ** in industry were somewhat less poor than in August, and they did not change in construction. However, they declined in trade and services. The fear from unemployment of households eased somewhat. **Inflationary expectations** of industry and services remained unchanged. The share of those planning price reductions increased in construction, whereas the share of those planning price rises went up in trade. However, inflationary expectations of households eased. **Expectations about the development of the Hungarian economy** improved a little in industry, whereas they declined in construction and services, and especially in trade. Consumers' expectations improved a bit.

Following a slight decrease in August, **GKI consumer confidence index** increased by a somewhat larger extent in September, approaching its peak value of this year (April). However, this level still reflects grave pessimism. People assessed their own financial positions and savings opportunities for the next year somewhat better than in August, and they saw a greater opportunity to purchase consumer durables as well.

## Explanation to the methodology:

In line with the methodology used by the EU, GKI surveys the expectations of industry, trade, construction and services in the calculation of its business confidence index. (As far as services are concerned, similarly to the practice of the EU, companies of the financial and public sectors have not been included in the surveys yet.) GKI publishes seasonally adjusted data by using appropriate mathematical methods to filter out the discrepancies caused by seasonal effects (e.g. differences in weather conditions between winter and summer, increased demand before Christmas, lower output because of summer vacations).

According to the new recommendation of the EU, GKI recalculated the former database with the new 'TEAOR 08' codes (statistical business activity codes) in January 2011.

The consumer confidence index is calculated from responses given to questions concerning the actual and the expected financial position of households, the actual and the expected economic situation of the country, and the purchase of higher value consumer durables.

The business confidence index is calculated from the responses of enterprises in industry, trade, construction and services given to questions concerning the state of business and expectations. The history of the subindex that reflects the expectations of services is shorter than that of other sectors. This kind of surveys started in 1998. Therefore the business confidence index for 1996-1997 had to be recalculated. This was made by using the mathematical correlation among the confidence indices of various sectors in the period after 1998.

GKI-Erste economic confidence index is the weighted average of the consumer confidence index and the business confidence index.
